GANs for Image Generation

Tutorial

Igor Kuznetsov

GANs Recap

$$\min_G \max_D V(D,G) = \mathbb{E}_{\boldsymbol{x}\sim p_{\text{data}}(\boldsymbol{x})}[\log D(\boldsymbol{x})] + \mathbb{E}_{\boldsymbol{z}\sim p_z(\boldsymbol{z})}[\log(1 - D(G(\boldsymbol{z})))]$$

Generative Adversarial Networks, 2014, Ian J. Goodfellow et. al

GAN Implementation

GAN Implementation: Generator

```python
class Generator(nn.Module):

    def __init__(self, z_dim=10, im_dim=784, hidden_dim=128):
        super(Generator, self).__init__()
        self._g = nn.Sequential(
            self._g_block(z_dim, hidden_dim),
            self._g_block(hidden_dim, hidden_dim * 2),
            self._g_block(hidden_dim * 2, hidden_dim * 4),
            self._g_block(hidden_dim * 4, hidden_dim * 8),
            nn.Linear(hidden_dim * 8, im_dim),
            nn.Sigmoid()
        )

    def _g_block(self, input_dim, output_dim):
        return nn.Sequential(
            nn.Linear(input_dim, output_dim),
            nn.BatchNorm1d(output_dim),
            nn.ReLU(inplace=True))

    def forward(self, noise):
        return self._g(noise)
```

GAN Implementation: Discriminator

```python
class Discriminator(nn.Module):

    def __init__(self, im_dim=784, hidden_dim=128):
        super(Discriminator, self).__init__()
        self._d = nn.Sequential(
            self._d_block(im_dim, hidden_dim * 4),
            self._d_block(hidden_dim * 4, hidden_dim * 2),
            self._d_block(hidden_dim * 2, hidden_dim),
            nn.Linear(hidden_dim, 1))

    def _d_block(self, input_dim, output_dim):
        return nn.Sequential(
            nn.Linear(input_dim, output_dim),
            nn.LeakyReLU(0.2))

    def forward(self, image):
        return self._d(image)
```

GAN Implementation: Model

```
class GAN:

    def __init__(self, z_dim, criterion, lr, device):
        self._g = Generator(z_dim).to(device)
        self._g_opt = t.optim.Adam(self._g.parameters(), lr=lr)

        self._d = Discriminator().to(device)
        self._d_opt = t.optim.Adam(self._d.parameters(), lr=lr)

        self._z_dim = z_dim
        self._criterion = criterion
        self._device = device
```

GAN Implementation: Losses

```python
def _calc_d_loss(self, batch_real, num_images):
    # Generate noise image nad get sample from G
    z = gen_noise(num_images, self._z_dim, self._device)
    fake_samples = self._g(z)

    # Get D's prediction for fake images
    y_fake_ = self._d(fake_samples.detach())
    fake_loss = self._criterion(y_fake_, t.zeros_like(y_fake_))

    # Get D's predition of real images
    y_real_ = self._d(batch_real)
    real_loss = self._criterion(y_real_, t.ones_like(y_real_))

    _d_loss = (fake_loss + real_loss) / 2.

    return _d_loss
```

GAN Implementation: Losses

```python
def _calc_d_loss(self, batch_real, num_images):
    # Generate noise image nad get sample from G
    z = gen_noise(num_images, self._z_dim, self._device)
    fake_samples = self._g(z)

    # Get D's prediction for fake images
    y_fake_ = self._d(fake_samples.detach())
    fake_loss = self._criterion(y_fake_, t.zeros_like(y_fake_))

    # Get D's predition of real images
    y_real_ = self._d(batch_real)
    real_loss = self._criterion(y_real_, t.ones_like(y_real_))

    _d_loss = (fake_loss + real_loss) / 2.

    return _d_loss
```

GAN Implementation: Losses

```python
def _calc_g_loss(self, num_images):
    # Generate fake images from noise vector
    z = gen_noise(num_images, self._z_dim, self._device)
    fake_samples = self._g(z)

    # Get D's prediction for the fake images
    y_ = self._d(fake_samples)
    _g_loss = self._criterion(y_, t.ones_like(y_))

    return _g_loss
```

GAN Implementation: Gradient Step

```python
def _update_step(self, batch_real, flatten_batch=True, *args):
    num_images = len(batch_real)
    if flatten_batch:
        batch_real = batch_real.view(num_images, -1)
    batch_real = batch_real.to(self._device)

    # D update
    self._d_opt.zero_grad()
    d_loss = self._calc_d_loss(batch_real, num_images)
    d_loss.backward(retain_graph=True)
    self._d_opt.step()

    # G update
    self._g_opt.zero_grad()
    g_loss = self._calc_g_loss(num_images)
    g_loss.backward()
    self._g_opt.step()

    return d_loss.item(), g_loss.item()
```

GAN Implementation: Trainer

```python
class Trainer:

    def __init__(self, data_loader, model, batch_size=128, device='cuda:0'):
        self.batch_size = batch_size
        self.dataloader = data_loader
        self.model = model

    def run(self, n_epochs, display_epoch=10, **kwargs):
        update_step = 0          # Total udpate step
        epoch_update_step = 0    # Update step within epoch
        mean_g_loss = 0          # Meach G loss for epoch
        mean_d_loss = 0          # Meach D loss for epoch
        display_epoch = 10       # Visualize once in
        device = config['device']

        for epoch in tqdm(range(n_epochs)):
            for batch_real, labels in self.dataloader:
                cur_batch_size = len(batch_real)

                d_loss, g_loss = self.model._update_step(batch_real,
                                                         labels=labels, **kwargs)
```

GAN Implementation: Training

```
# Load MNIST dataset
batch_size = 128
dataloader = DataLoader(
    MNIST('.', download=True, transform=transforms.ToTensor()),
    batch_size=batch_size,
    shuffle=True)

config = {
    'criterion': nn.BCEWithLogitsLoss(),
    'z_dim': 64,
    'lr': 0.00001,
    'device': 'cuda:0'
}
model = GAN(**config)

trainer = Trainer(dataloader, model)
trainer.run(n_epochs=50)
```
